#### Notes

- \* The power capaticty is determined according to AES2-1984 (r2003) standard. Program power is defined as the transducer's ability to handle normal music program material.
- $^{\star\star}$  Sensitivity was measured at 1m distance, on axis, with 1W input, averaged in the range 1 7 kHz.
- \*\*\* T-S parameters are measured after an exercise period using a preconditioning power test. The measurements are carried out with a velocity-current laser transducer and will reflect the long term parameters (once the loudspeaker has been working for a short period of time).
- \*\*\*\* The  $X_{max}$  is calculated as  $(L_{VC}$   $H_{ag})/2$  +  $(H_{ag}/3,5)$ , where  $L_{VC}$  is the voice coil length and  $H_{ag}$  is the air gap height.
